

January 2010

ROUTE-MASTER Fieldbus Device Couplers are available in field-mount enclosures complete with cable glands (aluminum enclosure shown), or as DIN-rail mount units.

ROUTE-MASTER uses a space-efficient rack-mount design to provide redundant power to up to eight intrinsically-safe segments.

Description

The ROUTE-MASTER Fieldbus System uses a patented split-architecture design to deliver the highest segment current to a hazardous area of ANY intrinsically-safe FOUNDATION fieldbus™ system. ROUTE-MASTER provides 350mA per segment—enough to power 16 fieldbus devices (20mA each) at 500m (1,500ft)—while remaining intrinsically-safe for hydrogen-risk areas at the individual spur connection. The system is comprised of a modular Power Supply/Conditioner Rack (RM100) combined with one, or multiple, ROUTE-MASTER Fieldbus Device Couplers (RMA100 or RMA100C). Featuring integral surge protection, the 19-inch Power Supply/Conditioner Rack provides redundant, galvanically-isolated and conditioned DC power for up to eight fieldbus segments. The RMA100 and RMA100C Device Couplers are available in models that handle four to 20 fieldbus devices.

Protect Segments from Spur Faults

ROUTE-MASTER Device Couplers provide electronic and fully auto-resetting spur short-circuit protection that prevent segment failure caused by single device faults. Utilizing a “FoldBack” technique, any spur that attempts to draw more than approximately 48mA is automatically switched off and not permitted any current flow until the fault is removed. This is a significant advantage over “current-limiting” designs on competing units which hold a fault permanently on the segment at a higher-than-normal current level. This often results in segment failure by overloading the segment power supply. With removal of the short, the spur is automatically reconnected to the fieldbus segment.

Features

- **Unique split-architecture design.** Allows an industry best 350mA for I.S. segments and allows the full 1900m per segment/120m per spur.
- **Connect directly to FISCO or Entity devices.** The ATEX-approved version Device Couplers (RMA100C) can be installed in IIB or IIC areas connecting FISCO or Entity devices.
- **Reduce commissioning delays.** ROUTE-MASTER Device Couplers feature patented* “Automatic Segment Termination” that eliminates the most common installation problem: segment failure from under or over termination, and assures local parts of a segment will continue to function if remote parts are accidentally disconnected. (The Manual Termination (-MT) option is also available for users who prefer manual termination.)
- **Speeds diagnostics and device configuration.** Diagnostic LEDs on the Device Couplers positively indicate status of spur power, any spur short circuits, and status of auto termination. The front panel features convenient connections for a fieldbus hand-held communicator.
- **High-availability power supply.** The RM100 Power Conditioner combines redundant DC power per segment with highly reliable passive conditioning to help assure an exceptionally reliable fieldbus segment.

* United States Patent No. 7,355,438 and Great Britain No. 2,407,237

RM100

ROUTE-MASTER® Fieldbus System (Intrinsically-Safe Installations)

Complete Intrinsically-Safe Fieldbus System

The ROUTE-MASTER Fieldbus System delivers intrinsically-safe segment power (350mA) and connects between a FOUNDATION fieldbus H1 card mounted in a safe area and fieldbus devices mounted in a hazardous area.

Fieldbus Segment Power Conditioning and Isolation

The ROUTE-MASTER's 19-inch Power Supply/Conditioner (RM100) converts an AC power input to up to eight fully-isolated DC channels (Figure 1). A DC Regulator Card (RM103B) controls the voltages of each of the individual channels. A second DC Regulator Card may be added to the rack to provide redundancy, load-sharing and hot-swap capabilities.

Trunk Isolator Modules (up to eight per rack) provide passive fieldbus conditioning, systems-side isolation and I.S. current-limiting for each fieldbus segment. The output from each Trunk Isolator Module (RM102B) is a galvanically-isolated, redundantly-powered, passively-conditioned and intrinsically-safe fieldbus trunk that can be connected into a hazardous area. No I.S. ground is required.

The RM102B Trunk Isolator Module provides dual outputs from the same H1 segment input, with each providing independent I.S. current-limiting. This technique minimizes irrecoverable voltage drop and maximizes the power available in the field.

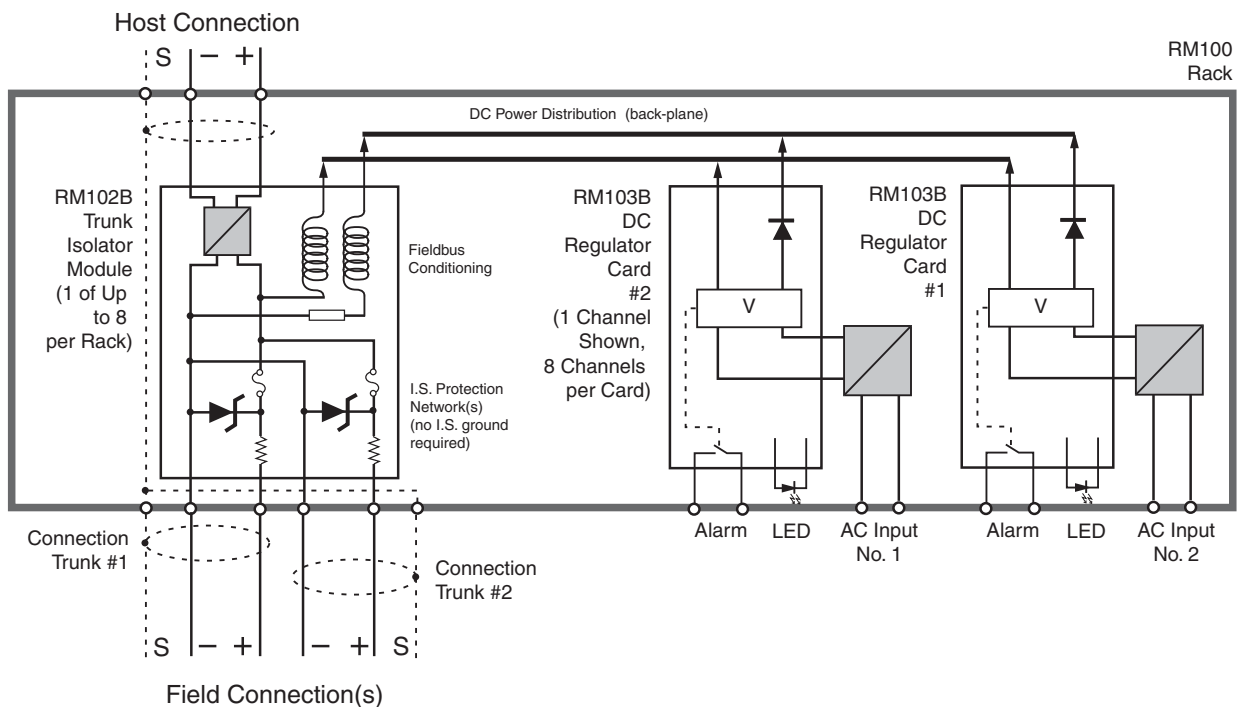

Each trunk is available for connection to separate RMA100 and RMA100C Device Couplers, which remain part of the same segment. When used in this way, the individual trunk currents per leg create voltage drop only in that leg, avoiding the losses which would be imposed if all devices were powered from a single trunk.

Because the Trunk Isolator Module has independent I.S. power limitation per trunk, each trunk is considered as a separate I.S. circuit and there are no complications for use in a hazardous area.

The dual trunk configuration allows 16 devices with 500m (1640ft) cable, even in areas classified as IIC/Groups A and B. The use of both trunks in this way is optional, and single trunk connection may be preferred where total cable length is short and device numbers and/or total current draw within the segment is low. In single trunk applications, a local terminator (TRK-TERM) should be fitted to the unused channel of the Trunk Isolator Module.

Note: Trunk Isolator Modules do not power the systems side of a H1 card. Specify the RM110 PowerTray if this function is required.

Figure 1. RM100 Power Conditioner Rack Connections.

Fieldbus Device Couplers

The intrinsically-safe trunk powered by the ROUTE-MASTER's Trunk Isolator Module (RM102B) is available for connection to one (or more) ROUTE-MASTER Device Couplers. Device Couplers can be mounted in the field or back-of-panel.

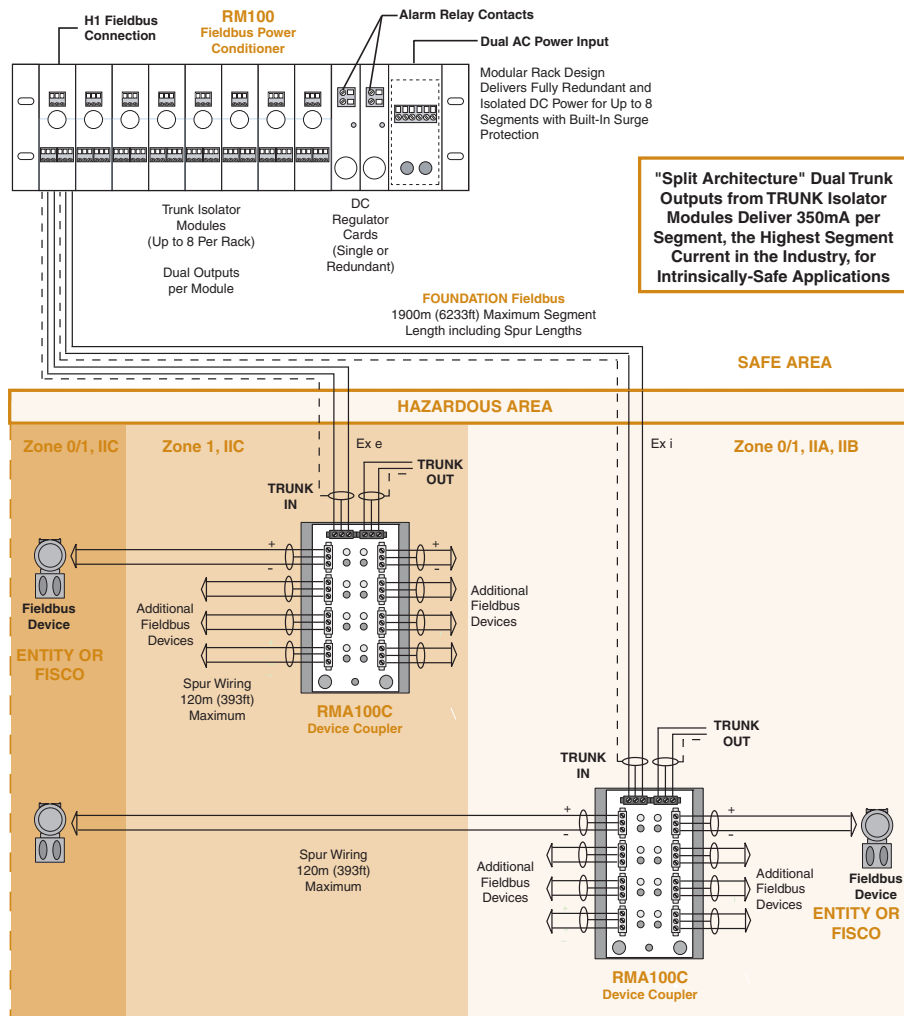

ROUTE-MASTER Device Couplers offer environmental and functional advantages that simplify fieldbus segment design.

Environmental Advantages—ROUTE-MASTER Device Couplers can be ordered in ready-to-install, field-mount enclosures designed for applications in rugged and hazardous field conditions. Options include aluminum (painted blue), GRP (Glass Reinforced Polyester) and stainless steel enclosures. All offer IP66 protection. Standard cable glands

are nickel-plated brass, and can be ordered for use with un-armored or armored cable. Compound seal glands (for cable with inter-core spaces, i.e., unfilled cable), and quick-connect plugs and sockets are also available.

Functional Advantages—MooreHawke Device Couplers offer functional advantages over the competition. This includes our unique short circuit protection (see Page 1) and patented "Automatic Segment Termination", which also enables easy extension of the segment through additional device couplers without re-termination issues. The Manual Termination (-MT) Option is available for users who prefer manual termination. Other advantages include convenient field test points for hand-held communicators.

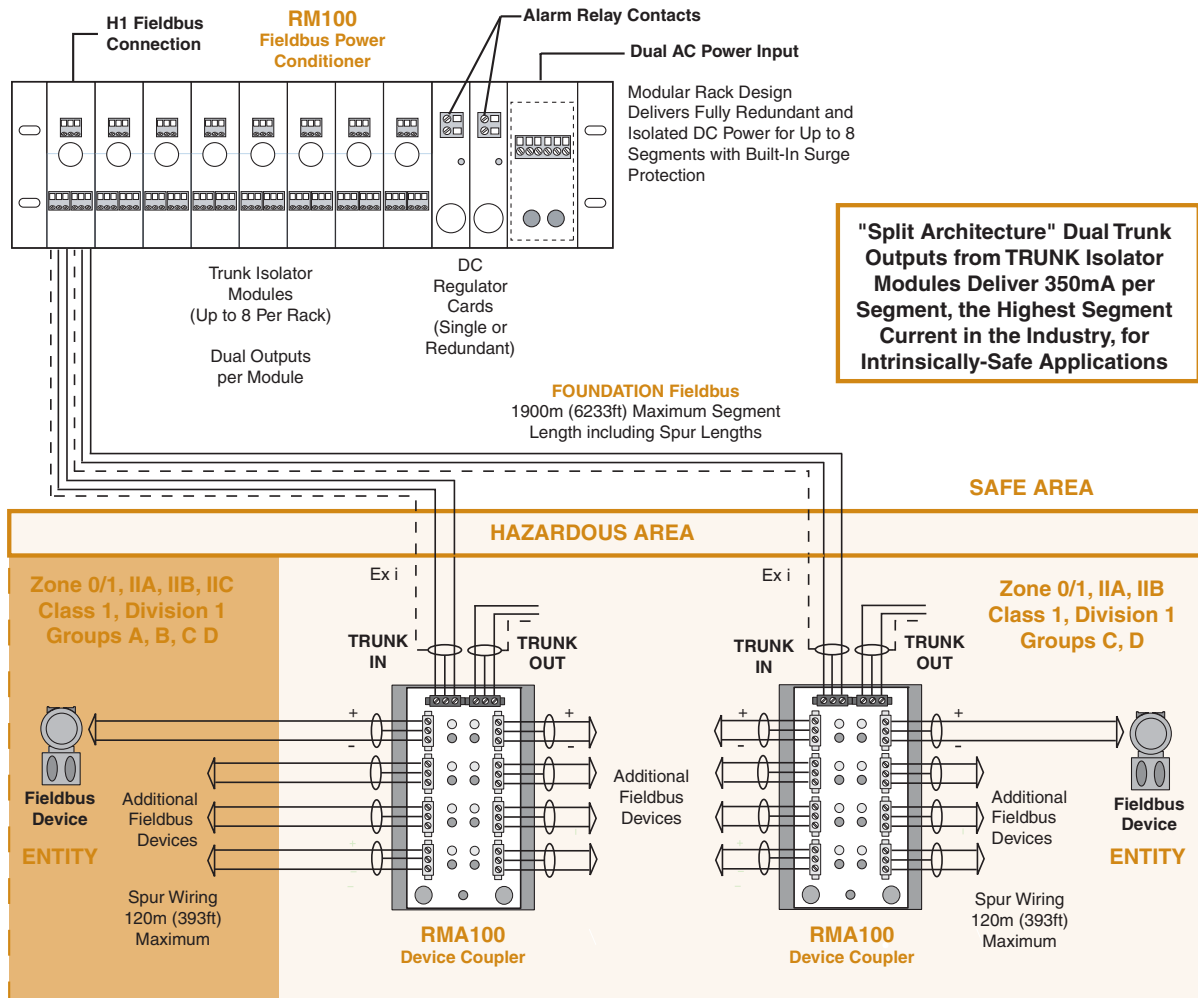

Figure 2A. The ATEX approved, FISCO compatible ROUTE-MASTER features Device Couplers that mount directly in IIC areas (Model RMA100C) and delivers 350mA per segment into hazardous locations.

Accessories:

Description	Model Number
Trunk Terminator	TRK-TERM***
Surface Mounting Bracket for RM100 Rack*	RMB-001
Spare DC Regulator Card	RM103B
Spare Trunk Isolator Module	RM102B
Power Tray (see Data Sheet for details)**	RM110-8-S

* One pair provided with each RM100 Rack. This option is for retrofit or replacement.
 ** Required for use with Emerson, ABB, Honeywell systems. Consult the factory for other
 manufacturer's systems that may require this accessory.
 *** May be required per RM102B Trunk Isolator Module when used in single-trunk mode. Trunk
 termination may also be performed by the Host or the RM110 Power Tray.

Entity Systems and Cable Parameters

A ROUTE-MASTER System with a model RMA100 Device Coupler can be installed in a IIA or IIB location, but can be connected to devices in IIC locations (Figure 2B). As an Entity System, it is necessary to demonstrate that the design does not exceed the specified (Entity) parameters for the location.

The unique split-architecture design of RM100 means that this calculation need only be completed once and will cover the entire plant installation.

First, calculate the capacitance of a worst case trunk cable and spur; 120m of the chosen cable plus an FF816 device. This will certainly be less than the 262nF allowable in IIC.

Second, calculate the L/R ratio for the chosen cable (most manufacturers only quote inductance and resistance values on their datasheets). This should calculate out to around 25 L/R or so.

Third, document these calculations with an annotation that no spur can be longer than 120m. Also document that the calculations include the longest trunk. Finally, document that no other type of cable is being used in these I.S. fieldbus networks.

Note that each spur cable (and also trunk cable in dual-trunk configuration) is a separate I.S. network. Parameters for these cables are not added together.

Combination FISCO and Entity Systems

As shown in Figure 2A, the RMA100C Device Coupler can receive FISCO or Entity devices from up to 120 meters with the device coupler located in IIA, IIB or IIC. Note that if placed in IIC, the trunk cable must be Ex e rated. All spur

cable is Ex i regardless of RMA100C location. If FISCO approved Ex i cable is used with the FISCO device, then no spur cable parameters need be calculated. If entity devices are to be connected then calculate the cable parameters for the longest trunk and longest spur. This calculation of the longest trunk and the longest spur (120m) would then be sufficient to cover the entire site, so that no further entity calculations need to be performed.
